Networking production and measurement

Two innovators committed to precision, working together

Reishauer AG, maker of gear grinding machines, and Mahr GmbH, specializing in production measurement technology, have decided to work together in the future in development and sales, aiming not only to expand the technological capabilities of both, but also complement their product portfolios. The new agreement reaffirms the longstanding relationship of trust and cooperation between the two Companies, while maintaining their mutual independence.

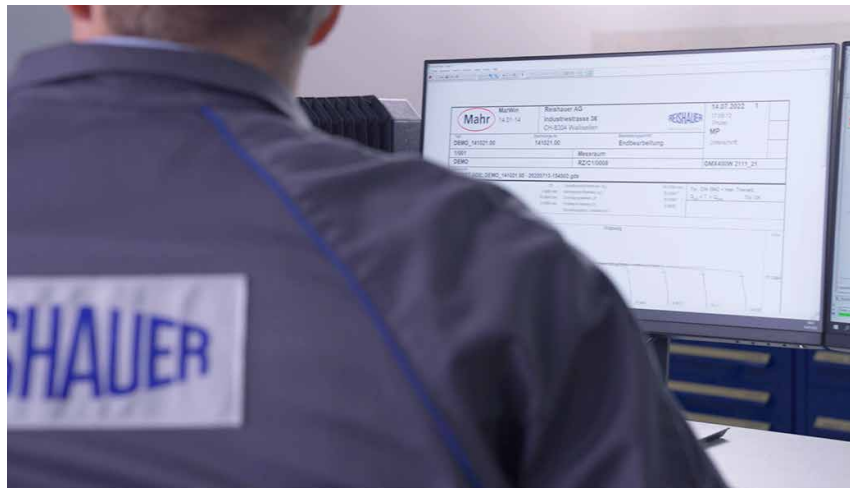

To serve our customers better, these two market-leaders have decided to work with each other in order to bring together the best of both worlds. On the one hand, the extreme precision with which Reishauer's machines grind gears in series, and on the other, Mahr's competent, flexible and reliable gear and form measuring technology. From decades of working together, both Companies are already intimately familiar with the type of workpieces that need the tightest tolerances.

Reishauer and Mahr: the best of both worlds

Both Reishauer and Mahr are both deeply interested in digitization and e-mobility. Today, increasingly efficient gearing goes hand in hand with reduced manufacturing tolerances, which requires closely intertwined production and measurement processes.

We expect this new agreement will deliver innovative and efficient solutions for our customers, enabling us to further strengthen our market position against competitors. The resulting products and services will be sold independently of each other.

Customers benefit from the networking of production and measurement

- Overall processes are faster, more efficient and more precise
- Productivity is enhanced
- Consistent digitization greatly encourages technology
- Complete solutions are especially flexible
- 100% traceability
